HR Manager

DECLARATION

I, **Kunal Raj**, hereby declare that the project report entitled "**Starbucks Landing Page - A Front-End Development Project**" as **The Internship Project** is a record of my original work undertaken during the online internship program at Rafiki Solutions Pvt. Ltd.

This project was a culmination of my academic journey in computer science, specifically focusing on front-end development principles. I completed this project under the esteemed guidance and supervision of **Mr. Umang Pal**, HR Manager and Project Coordinator at the institute. His expertise and mentorship were instrumental in shaping this project and refining my front-end development skills.

I acknowledge that this report is submitted in partial fulfilment of the requirements for the internship program and has not been submitted for any other academic purpose. I take full responsibility for the content presented in this report, and to the best of my knowledge, it is original and properly cites all references and external sources used.

Signature

Kunal Raj

Haldia Institute of Technology

ACKNOWLEDGEMENT

Success of any project depends largely on the encouragement and guidelines of many others. I take this sincere opportunity to express our gratitude to the people who have been instrumental in the successful completion of this project work.

I would like to express my deepest gratitude to **Mr. Umang Pal**, HR Manager and Project Coordinator at Rafiki Solutions Pvt. Ltd., for his invaluable guidance and support throughout this internship project.

I am particularly grateful for his patience in explaining complex concepts and his encouragement to explore innovative solutions. I always feel motivated and encouraged every time by his valuable advice and constant inspiration; without his encouragement and guidance this project would not have materialized. I also want to thank him for sharing their pearls of wisdom with me during this project.

Words are inadequate in offering my thanks to my classmates and teachers at Haldia Institute of Technology for their encouragement and cooperation in carrying out this project work.

Haldia Institute of Technology

ABSTRACT

This project involved the creation of a responsive landing page for Starbucks, leveraging the power of HTML, CSS, and JavaScript. This project is a sample copy of the **Starbucks Landing Page** which has been inspired from the actual Starbucks website.

Actual Website: <https://www.starbucks.in/dashboard>

The landing page serves as a digital storefront, immersing users in the Starbucks brand experience from the moment they arrive. High-quality visuals showcase inviting coffee beverages, tempting smoothies, and the warm, inviting atmosphere of Starbucks cafes.

Clear and concise navigation allows users to effortlessly discover information about Starbucks' products, promotions, and store locations.

Ultimately, this landing page serves as a valuable marketing tool, fostering brand awareness, increasing customer engagement, and potentially driving sales by enticing users to visit their local Starbucks or explore online ordering options.

PROJECT OBJECTIVE

The primary objective of this project was to gain practical experience in front-end web development by building a real-world application – a landing page for Starbucks.

This project aimed to:

1. Develop proficiency in HTML, CSS, and JavaScript:

By working on a project with a clear goal and target audience, I gained hands-on experience with HTML for structuring content, CSS for styling elements and creating a visually appealing layout, and JavaScript for adding interactivity and dynamic features. This practical experience solidified my understanding of these fundamental web development technologies and their capabilities.

2. Gain an understanding of user interface (UI) and user experience (UX) design principles:

Designing a landing page for Starbucks necessitated considering user needs and creating an intuitive and user-friendly interface. This project involved applying UI/UX design principles to craft a layout that is visually appealing, easy to navigate, and fosters a positive user experience. I focused on elements like clear calls to action, consistent navigation, and a layout that adapts to different screen sizes.

3. Implement responsive design practices to ensure the website adapts to different screen sizes:

In today's world, users access websites from various devices, ranging from desktops to tablets and smartphones. This project emphasized the importance of responsive web design practices. I ensured that the landing page would adjust its layout and elements to provide an optimal viewing experience on any device.

INTRODUCTION

Starbucks is a global phenomenon, synonymous with high-quality coffee and a warm, inviting atmosphere. From its humble beginnings in Seattle's Pike Place Market to its status as a coffee giant with a presence on nearly every continent, Starbucks has cultivated a loyal following.

The brand's success can be attributed to several factors, including its commitment to ethically sourced coffee beans, its focus on creating a comfortable and welcoming in-store experience, and its dedication to innovation in its beverage and food offerings.

However, Starbucks' success extends beyond its physical locations. The company has leveraged the power of the internet to further connect with customers and expand its reach.

A well-designed landing page serves as a digital storefront, providing a platform to showcase the brand's offerings and engage with potential customers.

The landing page can also highlight promotions, loyalty programs, and other initiatives that might entice potential customers. By presenting this information in a visually appealing and user-friendly way, the landing page can engage visitors and convert them into loyal customers.

In essence, the landing page serves as a digital first impression for Starbucks. It is a targeted web page designed to capture the attention of a specific audience, and in this case, the target audience is anyone interested in Starbucks coffee, beverages, or food.

The landing page should be informative, visually appealing, and persuasive, ultimately leading users to take a desired action, such as visiting a nearby Starbucks location or exploring the brand's online store.

Front-end development in **Web Development** is the craft of building the user-facing elements of a website. It is all about what users see and interact with when they visit a website. Front-end developers wear many hats, and their skillset encompasses a variety of tools and technologies.

Responsive Design: A core principle of front-end development is responsive design. In today's world, users access websites from a variety of devices, from desktops and laptops to tablets and smartphones.

Responsive design ensures that a website adapts seamlessly to different screen sizes and devices, delivering an optimal viewing experience regardless of the device used.

Front-end developers employ various techniques and frameworks to achieve responsive design. They might use flexible layouts, media queries, and responsive images to ensure the website adjusts its layout and content to fit the screen size.

Responsive design techniques and frameworks empower front-end developers to create websites that provide an exceptional user experience across all devices.

By employing flexible layouts that adjust content based on screen size, using media queries to target specific devices and tailor content accordingly, and incorporating responsive images that optimize for different resolutions, front-end developers ensure that their creations are accessible and visually appealing to a wider audience.

METHODOLOGY

The project followed a structured approach that emphasized user-centric design principles. This means prioritizing the needs and expectations of the target audience throughout the design and development process.

Usability testing and user research were incorporated to ensure the landing page was not only visually appealing but also intuitive and easy to navigate.

The project methodology is as follows:

1. Planning and Design:

- a. **Competitor Analysis:** Researching existing Starbucks landing pages and those of competitor coffee shops to understand current trends and identify potential areas for differentiation.
- b. **User Research:** Conducting user research (surveys, interviews) to understand the target audience's needs, expectations, and browsing behavior on landing pages. This could involve creating user personas to represent key audience segments.
- c. **Information Architecture:** Defining the content hierarchy and user flow for the landing page. This ensures a logical and intuitive navigation experience for users.
- d. **Wireframing and Prototyping:** Creating low-fidelity wireframes to visualize the basic layout and structure of the landing page. Following this with a mid-fidelity prototype that incorporates more visual elements like placeholder text and images.

Usability testing can be conducted at this stage to identify any potential usability issues early on.

Finally, refining the design into a high-fidelity prototype that closely resembles the final landing page in terms of visual design and interactivity.

2. Development:

- a. Building the HTML structure for the landing page content, ensuring semantic markup for accessibility and SEO.
- b. Implementing CSS styling for layout, visuals, and typography, following best practices for responsive design.
- c. Utilizing JavaScript for animations, interactive elements, or forms (e.g., email signup form).
- d. Testing the landing page across different browsers and devices to ensure consistent functionality and visual presentation.

3. Evaluation and Deployment:

- a. Reviewing the functionality and user experience of the landing page through internal testing and potential user testing sessions.
- b. Addressing any identified issues and making necessary adjustments.
- c. Uploading the completed landing page to a web server for online access.

Types of Deployments:

- **Shared Hosting:** Affordable option for basic websites, but resources (CPU, memory) are shared with other websites on the same server.
- **Virtual Private Server (VPS):** Offers more control and resources than shared hosting, but requires some technical knowledge.
- **Cloud Hosting:** Scalable and reliable option, often with pay-as-you-go pricing. Great for websites with fluctuating traffic.
- **Static Site Generators (SSGs):** Useful for creating simple, fast-loading websites; HTML, CSS, and JavaScript are pre-rendered into static files for deployment.
- **Content Delivery Networks (CDNs):** Caches website content on geographically distributed servers for faster loading times for users all over the world.

SYSTEM ANALYSIS

While this project focused on a basic landing page, it can be further enhanced with additional functionalities, what the page provides, and how it can all be used for a better user experience and benefit. Some of them are as follows:

- **Use Case Diagram:**

- **Actors:** User, Admin, Service Authentication, Identity Provider, Credit Payment Service, PayPal (any payment service).
- **Use Cases:** User views menu, locates store, places order, Admin manages content, uploads promotions, accepts and applies coupon codes, customer authentication, user sign-in, checkout, payment, checking shopping cart.

Fig.1.1. Use Case Diagram of Landing Page of Commercial Website

- **Sections on the Pages:**

- **Hero Section:** Displays brand message
- **About Us:** Provides company information and Social Media icons with redirecting links to the respective sites
- **Menu:** Showcases beverage and food offerings
- **Store:** Helps users locate nearby Starbucks locations
- **Order Online:** Leads to an external ordering platform
- **Pay Section:** Input details for payment
- **Thank You:** Section after purchasing items
- **Offers:** Showcases new promotional offers
- **Shopping Cart:** Showcases the shopping cart, for viewing, updating, and deleting items from cart and proceeding to payment
- **Gift:** Holds the variety of options available for gifting
- **Calculations:** Calculates the order subtotal and total, applies the valid transaction charges and GST, provides option to proceed to payment
- **Learn More:** Leads to the official Starbucks website
- **Three Glasses:** Changes the colour of the image and its background

Fig.1.2. Landing Page Creation Workflow

Fig.1.3. User Flow Diagram

Fig.1.4. Purchase Process Flow Diagram

TECHNOLOGIES USED

This project relied on the core technologies of front-end web development to create the Starbucks landing page:

1. **HTML (Hypertext Markup Language):** HTML serves as the foundation of the web page, defining its structure and content. It utilizes a series of tags that instruct the web browser how to display the information.

For this project, HTML was used to structure the landing page layout, incorporating elements like headings, paragraphs, images, navigation menus, and forms (if applicable). Semantic markup practices were followed to ensure the code is not only readable and maintainable but also improves accessibility and search engine optimization (SEO).

Semantic markup involves using HTML tags that clearly describe the meaning and purpose of the content they enclose. For instance, instead of a generic `<div>` tag, a more semantic tag like `<header>` would be used for the header section of the landing page, or `<article>` for a blog post section. Search engines can better understand the content structure and context of the web page through semantic markup, potentially improving SEO ranking.

Features of HTML:

- **Structure:** HTML defines the basic building blocks of a web page, including headings, paragraphs, lists, images, videos, tables, and forms.
- **Elements:** Each element is a specific tag that signifies a particular part of the content. For example, `<h1>` defines a heading, `<p>` defines a paragraph, and `<img>` defines an image.
- **Attributes:** Elements can have attributes that provide additional information or modify their behavior. For instance, the `src` attribute of an `<img>` tag specifies the image source.

- **Hypertext:** HTML allows linking web pages together using hyperlinks (a.k.a. anchors). Clicking on a hyperlink leads users to another web page or a specific section within the same page.

Uses of HTML:

- **Building Web Pages:** HTML forms the core structure of all web pages, regardless of their complexity. It defines the layout, content organization, and basic visual presentation.
- **Creating User Interfaces:** HTML serves as the foundation for user interfaces in web applications. It defines the layout of buttons, menus, forms, and other interactive elements.
- **Email Newsletters:** HTML is often used to craft visually appealing and interactive email newsletters.
- **Data Representation:** While not its primary purpose, HTML can be used to structure and represent basic data in a web page.

Benefits of HTML:

- **Simplicity:** HTML is a relatively simple language to learn, even for beginners with no prior coding experience.
- **Universality:** All web browsers understand HTML, ensuring your web pages are displayed consistently across different platforms and devices.
- **Flexibility:** HTML provides a flexible structure that can accommodate various layouts, content types, and functionalities.
- **Foundation for Advanced Technologies:** HTML serves as the building block for more advanced web technologies like CSS (styling) and JavaScript (interactivity).
- **SEO (Search Engine Optimization):** Well-structured HTML can improve a website's search engine ranking by providing clarity for search engine crawlers.
- **Accessibility:** By utilizing semantic markup (using HTML elements that describe their content and meaning), websites become more accessible for users with disabilities and assistive technologies.

Additional Considerations:

- **Standardization:** HTML is a standardized language maintained by the W3C (World Wide Web Consortium). This ensures consistency and compatibility across different web browsers.
- **Evolution:** HTML has evolved over time with new features and elements being introduced in newer versions.
- **Complementary Technologies:** While HTML provides structure, CSS is used for styling the appearance of the web page, and JavaScript adds interactivity and dynamic functionality.

2. **CSS (Cascading Style Sheets):** CSS controls the visual presentation of the landing page, breathing life into the HTML structure. It allows developers to define styles for various elements, including layout, fonts, colours, backgrounds, and image properties.

Leveraging CSS, the project established a visually appealing and brand-consistent design for the landing page. Techniques like media queries were employed to ensure responsive design, guaranteeing the page adapts seamlessly to different screen sizes and devices (desktops, tablets, smartphones).

Media queries are CSS code snippets that allow developers to target specific screen sizes or device orientations and apply different styles accordingly. This ensures that the landing page remains user-friendly and visually engaging regardless of the device used to access it.

Features:

- **Selects and Styles Elements:** CSS allows developers to target specific HTML elements using selectors (e.g., tags like `<p>`, `<div>`, classes, or IDs) and define their visual properties. These properties encompass a vast array of styles, including:

- **Font Properties:** Font family, size, weight, colour, and style (italic, underline)
- **Background Properties:** Background colour, image, and its positioning
- **Layout Properties:** Positioning elements, creating columns, applying margins and padding
- **Borders and Shadows:** Styling the borders of elements and adding subtle shadows for depth
- **Box Model:** Defining the dimensions (content, padding, border, margin) of elements
- **Transitions and Animations:** Creating smooth transitions or animations between different element states (e.g., hovering over a button)
- **Media Queries:** Adapting website styles to different screen sizes and devices (responsive design) for optimal viewing experience across desktops, tablets, and smartphones.

Uses:

- **Visual Appeal:** CSS is essential for creating a visually appealing and user-friendly website. It allows developers to define a consistent design language, including colours, fonts, and layouts.
- **Branding:** CSS plays a vital role in establishing a website's brand identity. By applying specific styles and colours, websites can visually communicate their brand essence.
- **Layout and Structure:** CSS enables fine-grained control over the layout and structure of a web page. Elements can be positioned precisely, creating columns, grids, and other layout elements that enhance the organization and hierarchy of information.
- **Responsiveness:** With media queries in CSS, websites can adapt their styles to different screen sizes, ensuring optimal viewing across all devices. This is crucial in today's mobile-first web development landscape.

- **Accessibility:** CSS can be used to enhance accessibility for users with disabilities. For example, increasing font size, adjusting color contrast, and adding hover effects on buttons can all improve the user experience for people with visual impairments.
- **Separation of Concerns:** CSS separates the presentation (styles) from the content (HTML structure). This promotes code maintainability, reusability, and easier collaboration between designers and developers.

Benefits:

- **Enhanced User Experience:** A website with well-defined CSS provides a more visually appealing and user-friendly experience for visitors. It makes it easier for them to navigate, find information, and interact with the website's features.
- **Improved Maintainability:** Separating styles from content with CSS makes code easier to maintain and update. Changes can be made globally by modifying a single CSS rule, saving time and effort.
- **Faster Page Load Times:** While not the most significant factor, well-written CSS can improve page load times by reducing the amount of HTML needed to define styles. Smaller CSS files translate to faster loading times.
- **Branding and Identity:** CSS is instrumental in establishing a website's brand identity. Consistent styles and color palettes throughout the website create a cohesive and recognizable brand experience.
- **Flexibility and Reusability:** CSS styles can be reused across multiple web pages, saving time and ensuring consistency. Additionally, CSS frameworks and libraries provide pre-built styles and components, further streamlining development.
- **Device Agnosticism:** With media queries, websites can be designed to adapt to various screen sizes and devices, ensuring a seamless browsing experience on desktops, tablets, and smartphones (responsive design).

3. **JavaScript:** While not essential for a basic landing page, JavaScript can add interactivity and dynamic functionality, significantly enhancing the user experience.

In this project, JavaScript could have been used for subtle animations, like product image carousels that automatically transition through featured beverages or food items. Hover effects on buttons could also be implemented using JavaScript, providing visual cues to users when they interact with clickable elements.

Furthermore, JavaScript could have been utilized for form validation, ensuring users enter data in the correct format before submitting a form (e.g., validating email addresses or phone numbers). Error messages can be displayed through JavaScript if a user enters invalid data, prompting them to correct the information before submission. JavaScript can also be leveraged to create more complex animations or interactive elements. For instance, accordions can be implemented for frequently asked questions sections, allowing users to click on a question to reveal the answer and hide other answer sections for a more organized and user-friendly experience. Image galleries with zoom functionality can also be created using JavaScript, enabling users to get a closer look at high-resolution images of beverages, food items, or even the inviting atmosphere of a Starbucks Cafe.

Features:

- **Interpreted Language:** No separate compilation step is required. Code is executed directly by browser, making development faster and more iterative.
- **Client-Side Scripting:** Primarily runs on the user's browser, reducing server load and enabling faster responsiveness.
- **Event-Driven:** Reacts to user interactions (clicks, key presses, mouse movements) and browser events, allowing for dynamic behavior.
- **Prototypal Inheritance:** Objects inherit properties and methods from other objects, providing a flexible way to create reusable code.
- **Functional Programming Capabilities:** Supports functions as first-class citizens, enabling powerful abstractions and modularity.

- **Asynchronous Programming:** Can handle multiple tasks concurrently, improving responsiveness and user experience.
- **DOM (Document Object Model) Manipulation:** Allows JavaScript to directly interact with web page elements, adding dynamic content, modifying styles, and responding to user actions.
- **AJAX (Asynchronous JavaScript and XML):** Enables communication with web servers in the background without full page reloads, creating a more seamless user experience.
- **Large and Active Community:** Extensive libraries, frameworks, and tools are available to enhance development speed and capabilities.

Uses:

- **Interactive Web Elements:** Create dynamic web pages with features like clickable buttons, form validation, image carousels, and animations.
- **Single-Page Applications (SPAs):** Build web applications that load only once and update content dynamically, providing a more app-like experience.
- **Web Games:** Develop engaging web games with interactivity, physics simulations, and complex mechanics.
- **Server-Side Scripting (with Node.js):** JavaScript can now extend beyond the browser and run on the server using environments like Node.js, enabling real-time applications, data processing, and server-side API development.
- **Mobile App Development:** Frameworks like React Native and Ionic allow building mobile apps using JavaScript, increasing code reuse and efficiency.
- **Internet of Things (IoT):** Interact with and control IoT devices using JavaScript, enabling automation and data visualization.

Benefits:

- **Enhanced User Experience:** Makes web pages more interactive, engaging, and dynamic, leading to increased user satisfaction and retention.
- **Reduced Server Load:** Client-side scripting minimizes server load, improving website performance and scalability.

- **Rapid Prototyping:** Allows for quick creation of interactive prototypes and testing user interactions before full-fledged development.
- **Cross-Platform Compatibility:** Modern JavaScript code can run on most web browsers, regardless of operating system.
- **Large Talent Pool:** JavaScript has a vast developer community, making it easier to find skilled developers for your projects.
- **Wide Range of Applications:** The versatility of JavaScript extends beyond web development, opening doors to various domains like mobile apps, desktop applications, and IoT development.
- **Abundant Libraries and Frameworks:** A rich ecosystem of libraries and frameworks simplifies common tasks, accelerates development, and promotes code reuse.
- **Relatively Easy to Learn:** While JavaScript has its nuances, its syntax is considered relatively beginner-friendly compared to other programming languages.

Beyond the Basics:

JavaScript is a constantly evolving language, and its capabilities keep expanding. Here are some advanced features to explore:

- **Promises:** Improve asynchronous code handling, making it more readable and maintainable.
- **Modules:** Organize your code into reusable modules, promoting better code structure and maintainability in large projects.
- **Classes:** Offer a more object-oriented approach to structuring code, suitable for complex applications.
- **Web Assembly (WASM):** Allows compiling code written in languages like C++ or Rust to run in the browser, enabling high-performance applications.
- **TypeScript:** A superset of JavaScript that adds optional static typing, improving code clarity and catching errors early in the development process.

CONCLUSION & FUTURE SCOPE

This project successfully culminated in the creation of a functional and visually appealing landing page for Starbucks. By leveraging the core principles of front-end development – HTML, CSS, and potentially JavaScript – the project provided an opportunity to gain valuable practical experience. Throughout the development process, a user-centric approach was prioritized.

The development phase involved building the HTML structure, ensuring semantic markup for accessibility and SEO. CSS styling was then implemented to create the layout, visuals, and typography, adhering to best practices for responsive design. JavaScript (if applicable) was utilized for animations, interactive elements, or forms. Testing across different browsers and devices ensured consistent functionality and visual presentation.

This project not only served as a learning experience in front-end development but also highlighted the importance of user-centred design principles.

The landing page aims to not only showcase the Starbucks brand but also provide a positive user experience, potentially leading users to explore further or visit a nearby Starbucks location.

While this project focused on a foundational landing page, it possesses the potential for further enhancements and additional functionalities:

- **Interactive Menu:** Implementing an interactive menu with detailed descriptions and high-quality images of the beverages and food items would further engage users and entice them to explore Starbucks' offerings. This could potentially include options to filter by category (e.g., hot coffee, iced beverages, seasonal drinks) or dietary restrictions (e.g., dairy-free, sugar-free options).
- **Enhanced Store Locator:** Integrating a map functionality within the store locator would significantly improve user experience. Users could search for nearby Starbucks locations based on their zip code or current location. The map could

display relevant information for each location, such as address, operating hours, and store amenities (e.g., drive-thru availability, indoor/outdoor seating).

- **Contact Form or Live Chat:** Adding a contact form or live chat feature would allow users to directly interact with Starbucks customer service. This could be particularly useful for addressing questions about specific products, store locations, loyalty programs, or promotions.
- **Personalization:** Leveraging user data and browsing behavior could allow for personalized content recommendations or targeted promotions.
- **Integration with Loyalty Programs:** Connecting the landing page with Starbucks' loyalty program could allow users to access their rewards information or redeem points directly.
- **Accessibility Features:** Implementing advanced accessibility features would ensure a positive user experience for all visitors, including those with disabilities.

By continuously exploring new possibilities and prioritizing user needs, the Starbucks landing page can evolve into a dynamic and engaging platform that strengthens brand awareness and customer relationships.
